Code Refactoring
1. Modified and added destructor the correct way to deallocate at the end
2. Deleting most of the commented out lines for testing previously.
3. Fixed a lot of indentions all over the whole file
4. Added lots of comments for better understand
5. Since the logic is correct and the code works there is not much code revising going one.
6. Used a great deal of understandable variable names so my code should be easily understood by most
7. There were duplicate codes in insert and find function which I have already removed
8. There were no use of global variables
9. Removed all the commented codes out that was used for testing
10. Added documentations for each method
11. As for Ternary search trees, there are left, mid and right pointers. I initialized them in the constructor in the beginning, and the last with the deleteAll method to destruct all the non-null nodes.
12. Fixed a bug at line 248 where I forgot to call the method deleteAll
13. Added several conditions for some cases checking
14.
